# The SAP on Azure customer cloud journey

# Demo motivation and positioning

- Demonstrate Lego-like integration between Azure IoT and SAP ECC based on SAP Gateway
- Public repeatble setup of the demo based on :
  - Public Azure Raspberry emulator
  - Public SAP demo system
  - Azure IoT Hub and Logic App
- Basic modification of existing Azure IoT tutorial to demonstrate SAP connectivity
- This is demo not Enterprise IT!

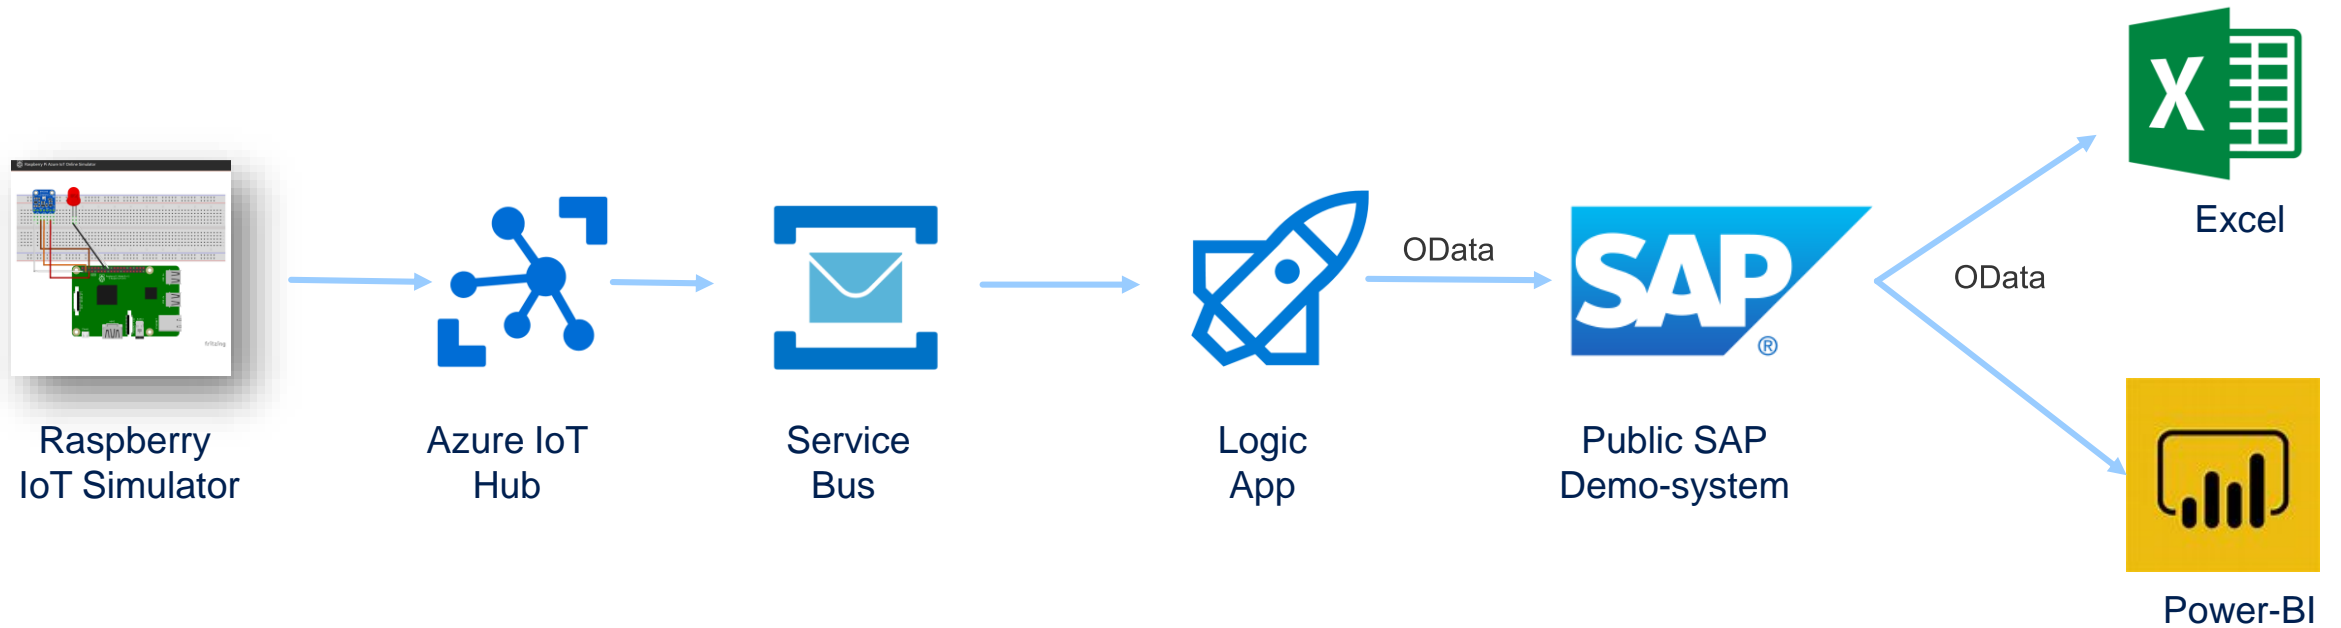

# Demo scenario and basic storyline

- Imagine the Raspberry Emulator as a IoT device used in shipping of heat-sensitive vaccines
- If the temperature is measured above 30°, the vaccine is damaged and must be replaced
- To replace the vaccine, a sales order is automatically created in SAP ECC in case the measured temperature is above 30°
- For excel users the current sales order SAP ECC will be displayed in Excel

# Demo scenario

# Demo implementation

# Demo implementation

# Demo preparation: Raspberry PI emulator and IoT Hub

- Implement Raspberry PI emulator tutorial ([Link](#))
- Implement IoT remote monitoring and notifications with Azure Logic Apps connecting your IoT hub and mailbox tutorial ([Link](#))
  - Stop at the paragraph “Configure the logic app trigger”

## IoT remote monitoring and notifications with Azure Logic Apps connecting your IoT hub and mailbox

04/19/2019 • 8 minutes to read • Contributors all

### Note

Before you start this tutorial, complete the [Raspberry Pi online simulator](#) tutorial or one of the device tutorials; for example, [Raspberry Pi with node.js](#). In these articles, you set up your Azure IoT device and IoT hub, and you deploy a sample application to run on your device. The application sends collected sensor data to your IoT hub.

[Azure Logic Apps](#) can help you connect your IoT hub to other services and across various protocols. A logic app can be sequenced using built-in connectors. This solution for IoT monitoring scenarios can initiate logic app workflows.

## Connect Raspberry Pi online simulator to Azure IoT Hub (Node.js)

04/11/2018 • 7 minutes to read • Contributors all

Raspberry Pi web simulator ▾

In this tutorial, you begin by learning the basics of working with Raspberry Pi online simulator. You then learn how to seamlessly connect the Pi simulator to the cloud by using [Azure IoT Hub](#).

If you have physical devices, visit [Connect Raspberry Pi to Azure IoT Hub](#) to get started.

START RASPBERRY PI SIMULATOR

### What you do

- Learn the basics of Raspberry Pi online simulator.
- Create an IoT hub.
- Register a device for Pi in your IoT hub.
- Run a sample application on Pi to send simulated sensor data to your IoT hub.

# Demo implementation

# Demo preparation: Access to public SAP demo system

- Get access to SAP Gateway demo system([Link](#))
- Get familiar with [GWSampleBasic Odata Service \(Visual-Code REST Client\)](#)
- Sample code: 

REST\_CLIENT\_SAP\_ODATA.txt

```
# sapes5.sapdevcenter.com
# Authorization: Basic [REDACTED]

# @name login
GET https://sapes5.sapdevcenter.com/sap/opu/odata/iwbep/GWSAMPLE_BASIC/$metadata HTTP/1.1
Authorization: Basic [REDACTED]
X-CSRF-Token: fetch

@authToken = {{login.response.headers.X-CSRF-Token}}

# @name salesOrder
POST https://sapes5.sapdevcenter.com/sap/opu/odata/iwbep/GWSAMPLE_BASIC/SalesOrderSet HTTP/1.1
Authorization: B [REDACTED]
X-CSRF-Token: {{authToken}}
Content-Type: application/json
```

## New SAP Gateway Demo System available

27 Likes 21,802 Views 98 Comments

### Updates

- 23.01.2018 – Show how to enter a TCODE
- 29.05.2018 – Added the section “*What you can’t do with the SAP Gateway Demo System*”
- 26.09.2018 – Added links to the \$metadata documents of the SAP Fiori Reference Apps
- 10.05.2019 – Added link to reset your password

The beta phase for our new SAP Gateway Demo system that was announced by Former Member in his blog [Netweaver Gateway Demo – ES5 now in Beta!](#) is now over and we can thus announce the availability of our new “production system” ES5.

As Jonathan already wrote we look forward to your feedback and encourage you to use our new system since ES4 will be shutdown in the future.

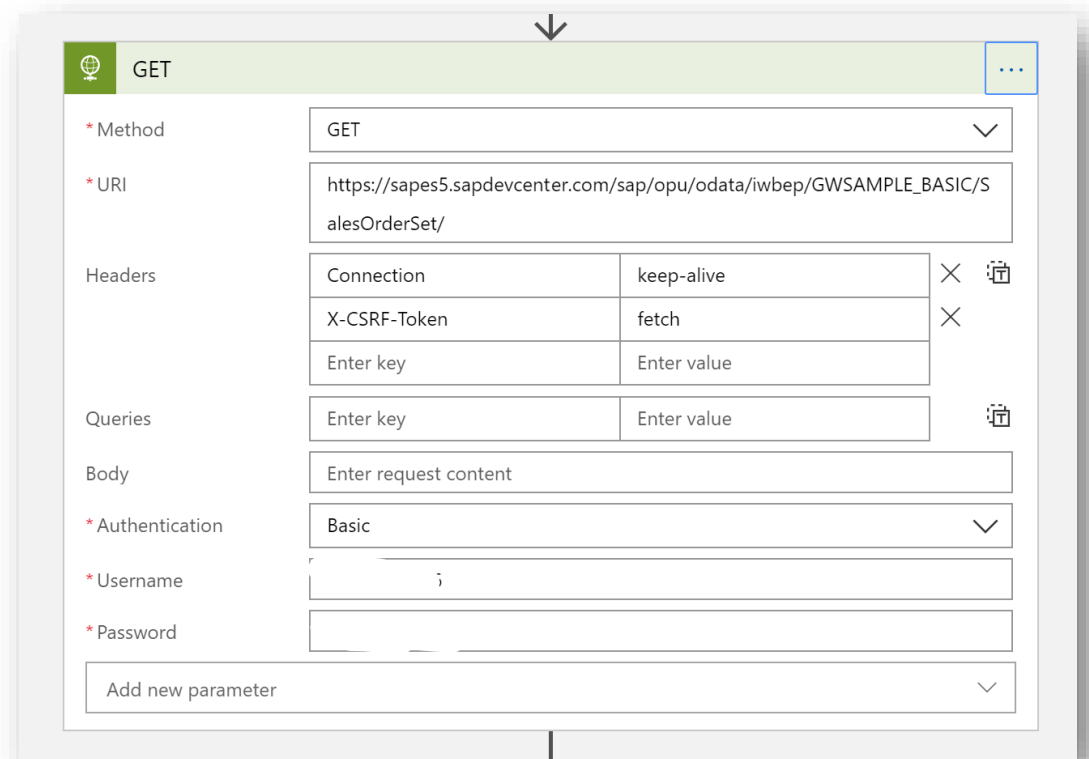

## What you can’t do with the SAP Gateway Demo System

# Demo implementation

# Demo implementation: Logic App 1/2

- Finish the [tutorial](#) until : Configure the logic app trigger / 5. Create a service bus connection.
- Instead of creating an STMP connection, create a HTTP GET Action
- URI: [Link](#)
- Header parameter:
  - Connection: keep-alive
  - X-CSRF-Token: fetch
  - Authentication: Basic
  - User/Pwd: Credentials for SAP demo system

The screenshot shows the configuration for a 'GET' action in a Logic App. The interface includes a title bar with a globe icon and the text 'GET'. Below this, there are several sections for configuring the HTTP request:

- \* Method:** A dropdown menu set to 'GET'.
- \* URI:** A text box containing the URL: `https://sapes5.sapdevcenter.com/sap/opu/odata/iwbep/GWSAMPLE_BASIC/SalesOrderSet/`.
- Headers:** A table with two columns for key and value. It contains two entries: 'Connection' with value 'keep-alive' and 'X-CSRF-Token' with value 'fetch'. There are 'X' and 'Add' icons to the right of the table.
- Queries:** A table with two columns for key and value, both labeled 'Enter key' and 'Enter value'. There is an 'Add' icon to the right.
- Body:** A text box labeled 'Enter request content'.
- \* Authentication:** A dropdown menu set to 'Basic'.
- \* Username:** A text box with a semicolon (;) as a placeholder.
- \* Password:** A text box.
- Add new parameter:** A button at the bottom with a dropdown arrow.

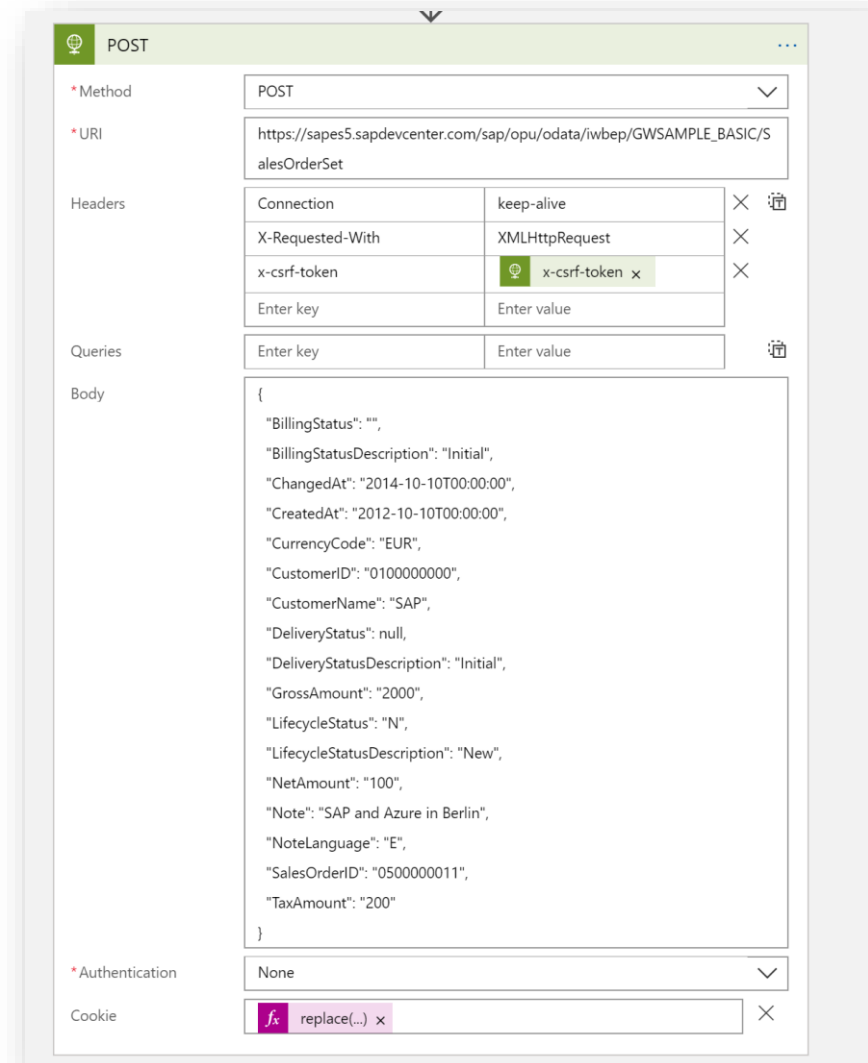

# Demo implementation: Logic App 2/2

- Append a HTTP POST Action to the GET-request
- The logic app creates an SAP sales order via the Odata Gateway

LOGIC\_APP\_SAP\_ODATA\_POST.txt

- Sample code for Logic App:
- Important parameters:
  - X-csrf-token: @outputs('GET')['headers']['x-csrf-token']
  - Function for cookie:  
**replace**(outputs('GET')['headers']['Set-cookie'], ',', ';')
- Further details in [Bartosz's Blog](#)

The screenshot displays the configuration for a POST action in a Logic App. The interface includes sections for Method, URI, Headers, Queries, Body, Authentication, and Cookie.

- Method:** POST
- URI:** https://sapes5.sapdevcenter.com/sap/opu/odata/iwbep/GWSAMPLE\_BASIC/SalesOrderSet
- Headers:**
  - Connection: keep-alive
  - X-Requested-With: XMLHttpRequest
  - x-csrf-token: x-csrf-token (with a value input field)
- Queries:** (Empty table with 'Enter key' and 'Enter value' columns)
- Body:**

```
{  "BillingStatus": "",  "BillingStatusDescription": "Initial",  "ChangedAt": "2014-10-10T00:00:00",  "CreatedAt": "2012-10-10T00:00:00",  "CurrencyCode": "EUR",  "CustomerID": "0100000000",  "CustomerName": "SAP",  "DeliveryStatus": null,  "DeliveryStatusDescription": "Initial",  "GrossAmount": "2000",  "LifecycleStatus": "N",  "LifecycleStatusDescription": "New",  "NetAmount": "100",  "Note": "SAP and Azure in Berlin",  "NoteLanguage": "E",  "SalesOrderID": "0500000011",  "TaxAmount": "200"}
```
- Authentication:** None
- Cookie:** replace(...)
